

Customer: I only added a customer ID and age to check for under 18
 i connected customer to ticket because it is the logical prerequisite of being a customer to a theatre

ticket: has a many to one connection to customer because one customer can buy many tickets
 then i connected ticket to movie with a one to many attachment using seat ID because each seatnumber can occur in each theatre

then in movie using movie name as the primary key it was also connected to ticket using seat id as a foreign key

concession was only connected to customer using customer id
